

The equality  $C^{*n}C^n = (C^*C)^n$  is not sufficient  
for quasinormality of a composition operator  $C$  in  
 $L^2$ -space

## Definitions of quasinormality

### Kaufman's definition of quasinormality

We say that a closed densely defined operator  $C$  in  $\mathcal{H}$  is quasinormal if  $C$  commutes with  $E_{|C|}$ , i.e.  $CE_{|C|} \subset E_{|C|}C$

### J. Stochel, F. H. Szafraniec definition of quasinormality

A closed densely defined operator  $C$  in  $\mathcal{H}$  is quasinormal if and only if  $U|C| \subset |C|U$ , where  $C = U|C|$  is the polar decomposition of  $C$

- Z. J. Jablonski, I. B. Jung, J. Stochel proved that this definitions are equivalent.

# Charakterization of quasinormal operators

## Theorem

Let  $C$  be a closed densely defined operator in  $\mathcal{H}$ . Then the following conditions are equivalent:

- $C$  is quasinormal
- $C^{*n}C^n = (C^*C)^n$  for every  $n \in \mathbb{Z}_+$ ,
- there exists a (unique) spectral Borel measure  $E$  on  $\mathbb{R}_+$  such that
$$C^{*n}C^n = \int_{\mathbb{R}_+} x^n E(dx) \text{ for } n \in \{1, 2, 3\}$$
- $C^{*n}C^n = (C^*C)^n$  for every  $n \in \{2, 3\}$

# Composition operators in $L^2$ -spaces

- $(X, \mathcal{A}, \mu)$  is a  $\sigma$ -finite measure space
- $\phi : X \rightarrow X$  is an  $\mathcal{A}$ -measurable transformation, i.e.,  $\phi^{-1}(\Delta) \in \mathcal{A}$  for every  $\Delta \in \mathcal{A}$
- If the measure  $\mu \circ \phi^{-1}$  given by  $\mu \circ \phi^{-1}(\Delta) = \mu(\phi^{-1}(\Delta))$  for  $\Delta \in \mathcal{A}$  is absolutely continuous with respect to  $\mu$  (we say that  $\mu$  is **nonsingular**), then the operator  $C_\phi$  in  $L^2(\mu)$  given by  $\mathcal{D}(C_\phi) = \{f \in L^2(\mu) : f \circ \phi \in L^2(\mu)\}$ ,  
 $C_\phi f = f \circ \phi, f \in \mathcal{D}(C_\phi)$   
is well-defined
- We call it a **composition** operator with **symbol**  $\phi$

## Weighted shifts on directed trees

- $\mathcal{T} = (V; E)$  is a directed tree ( $V$  and  $E$  are the sets of vertices and edges of  $\mathcal{T}$ , respectively)
- $V^\circ = V \setminus \{\text{root}\}$  if  $\mathcal{T}$  has a root and  $V^\circ = V$  if  $\mathcal{T}$  is rootless.
- $l^2(V)$  is the Hilbert space of square summable complex functions on  $V$  equipped with the standard inner product
- For  $u \in V$ , we define  $e_u \in l(V)$  to be the characteristic function of the one-point set  $\{u\}$ .

Given a system  $\lambda = \{\lambda_v\}_{v \in V^\circ}$  of complex numbers, we define the operator  $S_\lambda$  in  $l^2(V)$ , which is called a *weighted shift* on  $\mathcal{T}$  with weights  $\lambda$ , as follows

$$\mathcal{D}(S_\lambda) = \{f \in l^2(V) : \Lambda_{\mathcal{T}} f \in l^2(V)\} \quad (1)$$

$$S_\lambda = \Lambda_{\mathcal{T}} f \quad \text{for } f \in \mathcal{D}(S_\lambda); \quad (2)$$

where,

$$(\Lambda f)(v) = \begin{cases} \lambda_v f(\text{par}(v)) & \text{if } v \in \ell^2(V), \\ 0 & \text{otherwise.} \end{cases}$$

## Theorem

Let  $S_\lambda$  be a weighted shift on a directed tree  $\mathcal{T} = (V, E)$  with weights  $\lambda = \{\lambda_v\}_{v \in V^\circ}$ . Then the following assertions hold:

- (i)  $S_\lambda$  is a closed operator,
- (ii)  $e_u \in \mathcal{D}(S_\lambda)$  if and only if  $\sum_{v \in \text{Chi}(u)} |\lambda_v|^2 < \infty$  and in this case

$$S_\lambda e_u = \sum_{v \in \text{Chi}(u)} \lambda_v e_v, \quad \|S_\lambda e_u\|^2 = \sum_{v \in \text{Chi}(u)} |\lambda_v|^2 \quad (3)$$

- (iii)  $S_\lambda$  is densely defined if and only if  $e_u \in D(S_\lambda)$  for every  $u \in V$ .

## Theorem

Let  $S_\lambda$  be a densely defined weighted shift with weights  $\lambda$  and let  $S_\lambda = U|S_\lambda|$  be its polar decomposition. Then  $U = S_\pi$  where,

$$\pi_v = \begin{cases} \frac{\lambda_v}{\|S_\lambda e_{par(v)}\|} & \text{if } par(u) \in V_\lambda^+ \\ 0 & \text{otherwise} \end{cases}$$

## Theorem

Let  $S_\lambda$  be a weighted shift on a directed tree  $\mathcal{T}$  with weights  $\lambda = \{\lambda_u\}_{u \in V^\circ}$ . Then the following conditions are equivalent:

- (i)  $\mathcal{D}(S_\lambda) = \ell^2(V)$ ,
- (ii)  $S_\lambda \in B(\ell^2(V))$ ,
- (iii)  $\sup_{u \in V} \sum_{v \in \text{Chi}(u)} |\lambda_v|^2 < \infty$  If  $S_\lambda \in B(\ell^2(V))$ , then

$$\|S_\lambda\| = \sup_{u \in V} \|S_\lambda e_u\| = \sqrt{\sup_{u \in V} \sum_{v \in \text{Chi}(u)} |\lambda_v|^2} \quad (4)$$

## Theorem

Let  $n \in \mathbb{Z}_+$ . If  $S_\lambda \in B(l^2(V))$  is a weighted shift on a directed tree  $\mathcal{T} = (V; E)$  with weights  $\lambda = \{\lambda_v\}_{v \in V^\circ}$ , then the following two conditions are equivalent:

- (i)  $(S_\lambda^* S_\lambda)^n = (S_\lambda^*)^n S_\lambda^n$ ,
- (ii)  $\|S_\lambda e_u\|^n = \|S_\lambda^n e_u\|$  for all  $u \in V$ .

# Transcendentality of $\ln(\alpha)$

## Theorem (Lindemann-Weierstrass)

For any finite system of distinct algebraic numbers  $\alpha_1, \dots, \alpha_n$ , the numbers  $e_1^\alpha, \dots, e_n^\alpha$  are linearly independent over  $\mathbb{A}$

## Corollary

$\ln(\alpha)$  is transcendental for any algebraic number  $\alpha \neq 0, 1$ .

- Suppose  $\ln(\alpha)$  is algebraic. Then, by Theorem with  $\alpha_1 = 0$ ,  $\alpha_2 = \ln(\alpha)$ , we see that  $e^0$  and  $e^{\ln(\alpha)}$  are linearly independent over  $\mathbb{A}$  thus  $e^{\ln(\alpha)}$  is transcendental. But  $e^{\ln(\alpha)} = \alpha \in \mathbb{A}$  thus we have a contradiction.

# A question

- Is the equality  $C^{*n}C^n = (C^*C)^n$  sufficient for quasinormality of a composition operator  $C$  in  $L^2$ -space?

# Main Theorem

## Theorem

For every integer  $n \geq 2$ , there exist an injective, non-quasinormal composition operator  $C$  in  $L^2$ -space over a  $\sigma$ -finite measure such that

$$(C^*C)^n = C^{*n}C^n \quad (C^*C)^k \neq C^{*k}C^k \quad (5)$$

for all  $k \in \{2, 3, \dots\} \setminus \{n\}$ .

# Special directed tree

Leafless and rootless directed trees with one branching vertex of valency  $\aleph_0$

Let  $\mathcal{T} = (V, E)$  be a directed tree with

$$V = \{-k : k \in \mathbb{Z}_+\} \sqcup \{(i, j) : i, j \in \mathbb{N}\} \quad (6)$$

and

$$E = \{(-k, -k+1) : k \in \mathbb{N}\} \sqcup \{(0, (i, 1)) : i \in \mathbb{N}\} \sqcup \{((i, j), (i, j+1)) : i, j \in \mathbb{N}\} \quad (7)$$

(the symbol " $\sqcup$ " denotes disjoint union of sets).

# Special directed tree

Leafless and rootless directed trees with one branching vertex of valency  $\aleph_0$

Define the system of weights  $\lambda = \{\lambda_v\}_{v \in V}$  by

$$\lambda_v = \begin{cases} \alpha_i & \text{if } v = (i, 1), i \in \mathbb{N} \\ \beta_i & \text{if } v = (i, j), i \in \mathbb{N}, j \geq 2 \\ \gamma_i & \text{if } v = i, i \in \mathbb{Z}_+ \end{cases}$$

## Theorem

If  $n \geq 2$  and  $S_\lambda$  is a weighted shift on the directed tree  $\mathcal{F}$  then,  $(S_\lambda^* S_\lambda)^n = (S_\lambda^*)^n S_\lambda^n$  if and only if the following conditions holds

- (i)  $|\gamma_{k+n-1}|^n = |\gamma_{k+n-1}\gamma_{k+n-2}\dots\gamma_k| \quad k \in \mathbb{Z}_+$ ,
- (ii)  $|\gamma_{n-i-1}|^n = |\gamma_{n-i-1}\dots\gamma_0| \sqrt{\sum_{k=1}^{\infty} |\alpha_k \beta_k^{i-1}|^2} \quad i = 1, 2, \dots, n-1,$
- (iii)  $(\sqrt{\sum_{k=1}^{\infty} |\alpha_k|^2})^n = \sqrt{\sum_{k=1}^{\infty} |\alpha_k \beta_k^{n-1}|^2}.$

## Special sequence of function

we will consider some sequences of special functions For  $k \in \mathbb{Z}$ , we define  $S_k : (0, 1) \rightarrow (0, \infty)$  by

$$S_k(x) = 1^k + 2^k x + 3^k x^2 + \dots \quad (8)$$

## Lemma

The following assertions are valid.

- (i)  $S_k(x) \in \mathbb{Q}(x)$  for every  $k \in \mathbb{Z}_+$
- (ii)  $S_0(x) = \frac{1}{1-x}$ ,  $S_1(x) = \frac{1}{(1-x)^2}$ , and  $S_k(x) = \frac{m_k(x)}{(1-x)^{k+1}}$  for  $k = 2, 3, \dots$  where  $m_k$  is a polynomial of degree  $k - 1$  and 1 is not a root of  $m_k$  for  $k \geq 1$ .
- (iii)  $S_{-1}(x) = 1 + \frac{1}{2}x + \frac{1}{3}x^2 + \dots = \frac{\ln(1-x)}{x}$

### Theorem (Z. J. Jablonski, I. B. Jung, J. Stochel)

Let  $S_\lambda$  be a weighted shift on a rootless directed tree  $\mathcal{T} = (V; E)$  with positive weights. Then  $S_\lambda$  is unitarily equivalent to a composition operator  $C$  in an  $L^2$ -space over a  $\sigma$ -finite measure space. Moreover, if the directed tree is leafless, then  $C$  can be made injective.

Define

$$\alpha_k = \sqrt{k^{n-1}q^{k-1}}, \quad \beta_k = \sqrt{\frac{1}{k}c^{\frac{1}{n-1}}}, \quad (9)$$

where  $q, c \in \mathbb{Q}$  are chosen as follows

$$(S_{n-1}(q))^n = cS_0(q) \quad (10)$$

and

$$c^{\frac{k}{n-1}} \notin \mathbb{Q} \quad \text{for all } k \in \{1, 2, \dots, n-2\} \quad (11)$$

- $(S_\lambda^* S_\lambda)^p \neq (S_\lambda^*)^p S_\lambda^p$  for  $p \in \{2, 3, \dots, n-1\}$

Suppose, contrary to our claim that for some  $p \in \{2, 3, \dots, n-1\}$  the equality  $(S_\lambda^* S_\lambda)^p = (S_\lambda^*)^p S_\lambda^p$  holds. In view of Theorem, this equality implies that

$$\left( \sqrt{\sum_{k=1}^{\infty} |\alpha_k|^2} \right)^p = \sqrt{\sum_{k=1}^{\infty} |\alpha_k \beta_k^{p-1}|^2} \quad (12)$$

We verify that for the directed tree the last equation is of the form

$$\left( \sum_{k=1}^{\infty} k^{n-1} q^k \right)^p = c^{\frac{p-1}{n-1}} \left( \sum_{k=1}^{\infty} k^{n-p} q^k \right) \quad (13)$$

which we can write as

$$S_{n-1}(q) = c^{\frac{p-1}{n-1}} S_{n-p} q \quad (14)$$

Recall that by the condition (i) Lemma  $S_{n-1}(q) \in \mathbb{Q}$  and  $S_{n-p}(q) \in \mathbb{Q}$ . But this is a contradiction since  $c$  was such that  $c^{\frac{p-1}{n-1}} \notin \mathbb{Q}$ .

- $(S_\lambda^* S_\lambda)^p \neq (S_\lambda^*)^p S_\lambda^p$  for  $p = n + 1$

As in the previous case we see that the equality  $(S_\lambda^* S_\lambda)^{n+1} = (S_\lambda^*)^{n+1} S_\lambda^{n+1}$  implies that

$$\left( \sum_{k=1}^{\infty} \alpha_k^2 \right)^{n+1} = \sum_{k=1}^{\infty} \alpha_k \beta_k^{n+1}, \quad (15)$$

which is equivalent in this case with

$$\left( \sum_{k=1}^{\infty} k^{n-1} q^k \right)^{n+1} = c^{\frac{n}{n-1}} \sum_{k=1}^{\infty} \frac{1}{k} q^k \quad (16)$$

which one can note as

$S_{n-1}(q)^{n+1} = c^{\frac{n}{n-1}} S_{-1}(q)$  This is a contradiction because  $S_{n-1}(q) \in \mathbb{A}$  and  $c^{\frac{n}{n-1}} \in \mathbb{A}$  but  $S_{-1}(q) = \frac{\ln(1-q)}{q}$  is transcendental

- $(S_\lambda^* S_\lambda)^p \neq (S_\lambda^{*p}) S_\lambda^p$ . for  $p \in \{n+2, n+3, \dots\}$

Otherwise, we have

$$\gamma_{p-1-i}^2 = (\gamma_{p-1-i} \dots \gamma_0)^2 \sum_{k=1}^{\infty} \alpha_k \beta_k^{i-1} \quad (17)$$

for  $i = 1, 2, \dots, p-1$ , which implies that to

$$\gamma_{k-1-i}^{2n} = (\gamma_{k-1-i} \dots \gamma_0)^2 c^{\frac{2k}{n-1}} \sum_{k=1}^{\infty} \frac{1}{k} q^k \quad (18)$$

for  $i = n + 1$ . But this is a contradiction as in the previous case, because  $\gamma_i$  is an algebraic number and  $\sum_{k=1}^{\infty} \frac{1}{k} q^k$  is transcendental.

This completes the proof.
